

Case Study

Durethan® DP AKV 50 HR H2.0 for coolant manifold

Figure 1 Coolant manifold

Highly reinforced polyamide 66 (PA 66) is becoming increasingly popular in the automotive industry for the production of components for the cooling system. One example is the coolant manifold shown in Fig. 1, which is used in various Ford Sigma engines in some of the company's new models like the Fiesta. The part is made of Durethan® DP AKV 50 HR H2.0, a PA 66 from LANXESS reinforced with 50 percent glass fibers. The high stiffness of this material means that the ignition coil can be attached to the coolant manifold via an integrated support. This compact design enables a reduction in the space required for the engine.

The fully assembled coolant manifold is produced by the systems supplier Eaton at its Brierley Hill plant in England.

Because the ignition coil is attached to the coolant manifold, high leverage forces act on the fairly long subassembly due to engine vibrations and jarring

Material: Durethan® DP AKV 50 HR H2.0

Manufacturer: [Eaton](#), England

caused by potholes, etc. Despite this, the part must not show any signs of deformation, otherwise the flanges and outlet connections may begin to leak. The PA 66 combines high stiffness and strength with excellent impact resistance, allowing it to meet the manufacturer's stringent requirements at a lower weight than other designs. At room temperature in the conditioned state, this material has a very high elastic modulus of 10,600 MPa, which is around one third stiffer than a comparable standard PA 66 with 30 percent glass reinforcement. Because the fibers in the polyamide matrix are evenly distributed, the material properties are evenly distributed throughout the part.

Screw threads for other add-on components such as a temperature sensor are integrated directly into the molded part with the aid of inserts, facilitating subsequent assembly. When injection molding the part, the highly glass fibre reinforced material has the advantage that it can be demolded sooner due to its

high thermal conductivity and good stiffness at high temperatures. This ensures cost-effective manufacture with short cycle times.

In view of the ever higher temperatures encountered in the cooling circuit, a further advantage of this hydrolysis-resistant and heat-stabilized PA 66 is its good long-term resistance to hot cooling media. This was also confirmed by comparative tests using the standard Durethan® AKV 50 material as a reference. Specimens of both materials were immersed for

over 500 hours in a water-glycol mixture (1:1) at 130 °C and a pressure of 2 bar, after which their mechanical properties were measured. These tests showed that after immersion, Durethan® DP AKV 50 HR H2.0 has flexural modulus and flexural strain values that are over 50 percent better and impact strength values that are 70 percent better than the standard material.

The manner in which you use and the purpose to which you put and utilize our products, technical assistance and information (whether verbal, written or by way of production evaluations), including any suggested formulations and recommendations, are beyond our control. Therefore, it is imperative that you test our products, technical assistance and information to determine to your own satisfaction whether they are suitable for your intended uses and applications. This application-specific analysis must at least include testing to determine suitability from a technical as well as health, safety and environmental standpoint. Such testing has not necessarily been done by us. Unless we otherwise agree in writing, all products are sold strictly pursuant to the terms of our standard conditions of sale. All information and technical assistance is given without warranty or guarantee, and is subject to change without notice. It is expressly understood and agreed that you assume and hereby expressly release us from all liability, in tort, contract or otherwise, incurred in connection with the use of our products, technical assistance and information. Any statement or recommendation not contained herein is unauthorized and shall not bind us. Nothing herein shall be construed as a recommendation to use any product in conflict with patents covering any material or its use. No license is implied or in fact granted under the claims of any patent.

Developmental Product

Any product designated as a developmental product is not considered part of the LANXESS Corporation line of standard commercial products. Complete commercialization and continued supply are not assured. The purchaser/user agrees that LANXESS Corporation reserves the right to discontinue this product without prior notice.

Typical Properties

Property data is provided as general information only. Property values are approximate and are not part of the product specifications.

Health and Safety

Appropriate literature has been assembled which provides information concerning the health and safety precautions that must be observed when handling LANXESS products mentioned in this publication. Before working with these products, you must read and become familiar with the available information on their hazards, proper use, and handling. This cannot be overemphasized. Information is available in several forms, e.g., material safety data sheets (MSDS) and product labels. Consult your LANXESS Corporation representative or contact the Product Safety and Regulatory Affairs Department at LANXESS. For materials that are not LANXESS products, appropriate industrial hygiene and other safety precautions recommended by their manufacturer(s) must be followed.

Regulatory Compliance

Some of the end uses of the products described in this brochure must comply with applicable regulations, such as the FDA, NSF, USDA and CPSC. If you have any questions on the regulatory status of any LANXESS engineering thermoplastic, consult your LANXESS Corporation representative or contact the LANXESS Regulatory Affairs Manager.

Regrind

Where end-use requirements permit, regrind may be used with virgin material in quantities specified in individual product information bulletins, provided that the material is kept free of contamination and is properly dried (see maximum permissible quantities and drying conditions in product information bulletins). Any regrind used must be generated from properly molded/extruded parts, sprues, runners, trimmings and/or film. All regrind used must be clean, uncontaminated, and thoroughly blended with virgin resin prior to drying and processing. Under no circumstances should degraded, discolored, or contaminated material be used for regrind. Materials of this type should be discarded. Improperly mixed and/or dried regrind may diminish the desired properties of a particular LANXESS product. It is critical that you test finished parts produced with any amount of regrind to ensure that your end-use performance requirements are fully met. Regulatory or testing organizations (e.g., UL) may have specific requirements limiting the allowable amount of regrind. Because third party regrind generally does not have a traceable heat history or offer any assurance that proper temperatures, conditions, and/or materials were used in processing, extreme caution must be exercised in buying and using regrind from third parties. The use of regrind material should be avoided entirely in those applications where resin properties equivalent to virgin material are required, including but not limited to color quality, impact strength, resin purity, and/or load-bearing performance.
